

Education

University of North Texas

Ph.D. in Finance, Expected 2027

Teaching Fellowship; GPA: 3.8/4.0.

Research Areas: Empirical Asset Pricing, Corporate Finance, ESG, ETF Market Structure.

Teaching: *FINA 3770 – Introduction to Finance*; *FINA 4200 – Investments*.

Denton, TX

2023–Present

South Dakota State University

M.S. in Economics

Brookings, SD

2012–2014

Chongqing Jiaotong University

B.B.A. in Accounting

Chongqing, China

2007–2011

Honors & Awards

Doctoral Candidate Research Award, G. Brint Ryan College of Business. 2026

Presented at the Southwestern Finance Association (SWFA) Annual Meeting, Dallas, TX. 2026

Fifth-Year Doctoral Funding, G. Brint Ryan College of Business. 2026

Research

Working Paper: Arbitrage and Monetary Policymaker Disagreement

Presented at SWFA Annual Meeting; submitted to the Journal of Financial and Quantitative Analysis (JFQA).

- Studies how disagreement among Federal Reserve policymakers affects arbitrage in bond ETFs.
- Uses FOMC “dot plot” dispersion (2012–2023) as an observable measure of disagreement.
- Higher near-term dispersion is associated with fewer authorized participant share creations (warehousing duration risk).
- ETF prices deviate more from net asset value when disagreement is high, implying limits to arbitrage and implications for policy transmission.

Working Paper: Measuring Monetary Policy Uncertainty Through an Agentic AI Framework: The Virtual Federal Reserve, Dissertation Title

- Builds a multi-agent LLM simulation of FOMC meetings (239 meetings, 1996–2025) that predicts individual member votes with 91.7% accuracy.
- Introduces the Agentic AI MPU, a new measure of monetary policy uncertainty that captures committee disagreement hidden by institutional consensus.
- Shows the measure is distinct from existing uncertainty indices and identifies the federal funds rate and post-COVID inflation as key drivers of committee disagreement.

Working Paper: ETF Ownership and Idiosyncratic Risk

- A one standard deviation increase in ETF ownership is associated with lower idiosyncratic volatility and a lower implied cost of equity capital.
- ETF ownership is positively associated with R&D spending.
- Evidence across trading versus non-trading hours; two-stage least squares uses Russell 2000 reconstitutions as instruments.

Working Paper: Anomaly Returns at Night and Day

- Anomaly premiums shift from daytime to nighttime after academic publication and post-2003.
- Daytime returns reflect investor mispricing; nighttime returns reflect macroeconomic risk.
- Increased arbitrage activity contributes to attenuation in close-to-close anomaly returns.

Teaching

University of North Texas

Teaching Fellow

Courses: FINA 3770, FINA 4200. Responsible for lectures, grading, and student guidance.

Denton, TX

2023–Present

Certifications & Professional Service

2023–Present: CFA Charterholder.

2024: Discussant, FMA Annual Meeting.

2026: Presenter and Discussant, SWFA Annual Meeting.

Professional Experience

First Capital Securities Ltd.

Alternative Investment Portfolio Manager

2020–2023

Fund-of-funds research using Brinson and Barra frameworks; designed structured products for institutional clients.

CIMC PE Fund

Investment Manager

2018–2019

Governance, industry, and supply chain analysis; research on shale drilling technology and global energy implications.
